

## The Roles Being Created Right Now

The AI economy is not only taking jobs. It is building new ones. Most people can name the roles AI is disrupting. Far fewer can name the roles it is creating. Here is a snapshot of where genuine opportunity is emerging right now, in the UK:

- **AI Assurance Specialist** - Auditing AI systems for bias, accuracy and ethical compliance
- **Responsible AI Officer** - Embedding governance, risk and ethical frameworks across organisations deploying AI
- **AI Ethics Reviewer** - Assessing AI tools and outputs against responsible use standards
- **AI Governance Manager** - Building and maintaining the policies and oversight structures that keep AI accountable
- **AI Risk and Compliance Analyst** - Identifying, assessing and mitigating AI-related risk across business operations
- **AI Operations Manager** - Overseeing the day-to-day deployment and performance of AI systems in an organisation
- **AI Trainer and Facilitator** - Upskilling teams and individuals to work confidently and safely alongside AI
- **AI Policy Advisor** - Shaping the regulatory and governance frameworks that define how AI is used in public life
- **AI Procurement Specialist** - Evaluating and selecting AI tools and vendors against responsible use criteria
- **Human-AI Interaction Designer** - Designing the human experience of AI systems, ensuring they remain accessible, fair and effective

These roles **do not** require a computer science degree. They require strategic thinking, ethical judgement, communication, leadership and structured AI literacy.

That is precisely what AI Confidence for Women is built to give you.
